

SYSTEM AND METHOD FOR *UNIVERSAL IDENTIFICATION* OF BIOLOGICAL HUMANS

Abstract:

A system and method for uniquely identifying each human being and generate a Universal Identification Number (UIN) to aid tracking. UIN database comprises of public, health, and confidential information. The number issued for display on UIN Identity Card and used for accessing data on-line protects the privacy of the individual by hiding the sensitive information. Medical emergency data is provided to authorized hospitals and medical practitioners for advance preparedness to save lives. UIN database is accessible to law enforcement agencies, when authorized under specific circumstances. UIN prevents identity fraud by protecting unique identity of every human being and helps in tracing lost or wanted people. UIN fulfills a pending need for technological system to eliminate child abduction, identity fraud, credit card theft, and help in saving lives of people. Future UIN applications relate to biosensor integrated device interacting with radio signals for monitoring and rescuing patients.
